

Double pipe municipal water delivery systems.

According to journalist and author Janet Phelan, a double pipe municipal water delivery system is common in the United States and abroad. She says that when she was a columnist for the Santa Monica Daily Press, in Santa Monica California, she went to city hall and made a public records request for blueprints and work records of the Santa Monica water system. Later that same day, she got a voicemail from her editor at the Santa Monica Daily Press, saying that she did not have her permission to ask for water system records, and that in so doing, Janet was endangering her editor's position as editor for the paper by asking questions about water. Janet listened to the voicemail and then went to the newspaper office to talk to her editor. When she got to the office, she found that she was persona non grata, had been fired, and was no longer welcome on the premises. Janet had a friend who worked for the Los Angeles Times, (I believe that his name was Fred Aguilar) who she had told about her research on water distribution systems. This friend expressed interest in the subject, so she gave him the materiel her research had uncovered. He approached his editor about doing an article on the subject. He was immediately fired and escorted off the premises by security.

Janet realized that she was onto something big, so she went to a construction site in Los Angeles where work was being done on the water line beneath the street. She chatted up a worker and asked to see the blueprints for the work. He let her see them and she photographed them. The blueprints revealed two water lines beneath the street. Later, she investigated the municipal water systems of various cities around the country including Spokane, Washington, and Medford, Oregon. She also looked into the water systems in Canada and Switzerland. Wherever she looked, she found this same double pipe water system, which she said was equipped with remote controlled valves, and configured in such a way as to allow for neighboring houses on the same street to receive different water mixes without the customer's knowledge or consent. Janet considered this water system to be weaponized, and referred to it as a (covert) chemical/biological weapons delivery system. She went on to say that lock downs, aka "shelter in place" orders, would enhance the effectiveness of this system.

If you use municipal water, or if you have loved ones who do, you may find this subject to be of interest. For more information you can read Janet Phelan's articles in Activist Post, and various other publications. You can also read her latest book, *At the Breaking Point of History: How Decades of U.S. Duplicity Enabled the Pandemic*. You can also watch interviews with her on various platforms.
